LETTER OF APPRECIATION

Dear Dr. Igor Korkin,

On November 1, 2026, the KCon 2026 Hacker Conference successfully concluded at the Zhongguancun Exhibition Center in Beijing. Under the theme “Yizhi” (Strategic Intelligence), the conference brought together thousands of cybersecurity professionals and enthusiasts from across China. As the conference comes to a close, the KCon 2026 Organizing Committee extends its most sincere gratitude to you.

Your presentation, “When AI Agents Become Processes: Native Windows Isolation for Autonomous Code,” was delivered in a pre-recorded format. Beginning with your research on the offensive and defensive aspects of high-privilege user-mode keyloggers, you offered an in-depth analysis of the open-source DesktopRanger project and the progression of your research from protecting trusted applications to isolating untrusted AI workloads. You systematically explained three native Windows sandbox launch mechanisms—classic AppContainer, CPIS, and PSEC 1.1—and demonstrated a practical approach to running autonomous AI agent processes on a separate Windows desktop, together with experimental findings on their execution boundaries. Your talk combined substantial technical depth with a distinctive perspective and received an enthusiastic response following the conference.

Since its founding in 2012, KCon has been committed to providing a focused, open, and collaborative platform for the cybersecurity community. It is thanks to technical experts like you, who generously share their research results and practical experience, that KCon continues to deliver high-quality content and help advance technical expertise throughout the industry. We deeply value your support and contributions to this year’s conference.

Once again, thank you for your excellent presentation and generous support. We look forward to welcoming you back to the KCon stage in the future. With our very best wishes!

KCon 2026 Hacker Conference Organizing Committee
